Efficient Elliptic-Curve Cryptography using Curve25519 on Reconfigurable Devices

Pascal Sasdrich, Tim Güneysu

# Motivation

## Tor-Router

- Zynq FPGA on Zedboard
- router for Tor-network
- privacy protection
- defense against surveillance/analysis

<http://www.extremetech.com/>

## Car2Car Communication

- exchange of signed messages
- signature generation using ECC
- authenticity of messages
- protection against manipulation

<http://www.digilent.com/>

# Contribution

Curve25519 function was chosen for fast **software** implementations.

## *Our Contribution:*

1. First efficient high-speed **hardware** implementation of Curve25519.
2. Improvement of implementation through parallelization techniques.  
*More than 32000 point multiplications per second.*

3. Implementation
4. Improvements
5. Results and Comparison
6. Conclusion

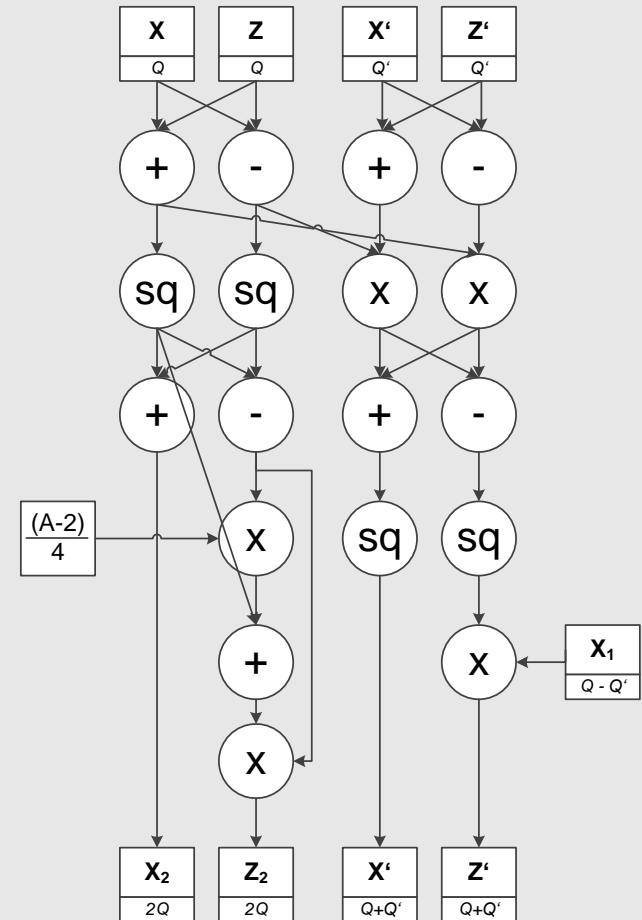

# Elliptic-Curve Cryptography

- Diffie-Hellman Key Exchange
- 255 calls of Double-And-Add function, timing constant
- Montgomery's Ladder, (always) Double-And-Add
- Modular reduction mod  $P$ , multiplication by 19, Pseudo Mersenne Prime

# Curve25519 Function

- **Inputs:**
  - $k$  (secret key, 255-bit)
  - $P$  (public point, affine coordinates  $x$  and  $y$ )
  
- **Computation:**
  - compute  $k \times P$  in 255 steps
  - scan  $k$  bitwise and call double-and-add algorithm
  - swap inputs  $X/Z$  and  $X'/Z'$  depending on scanned bit
  
- **Output:**
  - requires conversion from projective to affine coordinates
  - inversion of  $Z$  with Fermat's Little Theorem ( $Z^{-1} = X^{P-2}$ )
  - return result  $R = X \times Z^{-1}$

6. Conclusion

# Design Considerations

- **Target Platform:**

*latest Xilinx FPGA generation Zynq XC7Z020 on Digilent ZedBoad*

- **FPGA provides many DSP slices:**

*dedicated processors for integer operations*

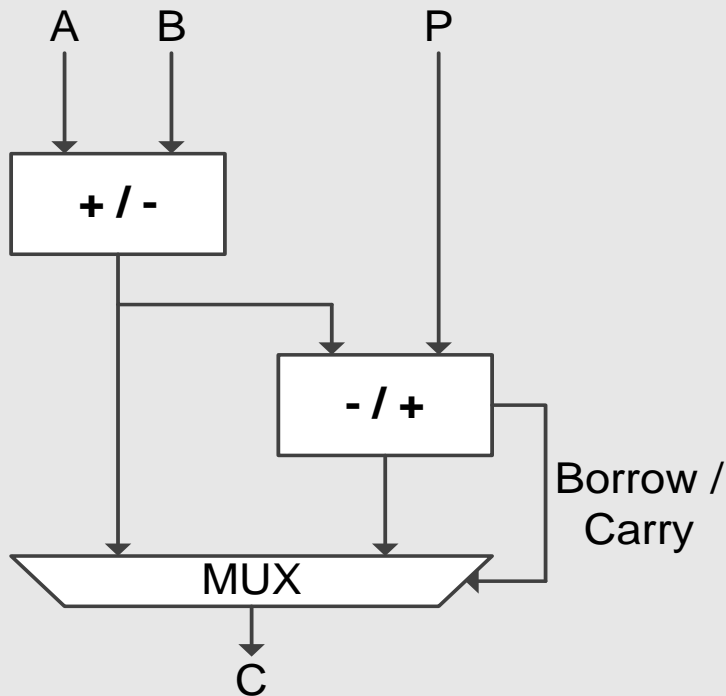

- **DSP addition and multiplication stages:**

*48-bit addition and 25x18-bit signed multiplication*

- **Curve25519 operands:**

*255-bit length, can be divided into 15 x 17-bit chunks*

# Finite Field Arithmetic

## Modular Adder $C = A + B \bmod P$ :

- always addition/subtraction and reduction
- output depends borrow/carry
- serial computation with 2 DSPs

## Efficient Elliptic-Curve Cryptography using Curve25519 on Reconfigurable Devices

Pascal Sasdrich, Tim Güneysu

# Finite Field Arithmetic

## Modular Multiplier $C = A \times B \bmod P$ :

- pre-reduction of partial products
- Reduction by multiplication with 19
- accumulation of 17x17-bit products
- final accumulation and reduction (modified modular adder)
- DSPs for addition, multiplication and accumulation
- pipelining increases throughput

# Point Addition and Doubling

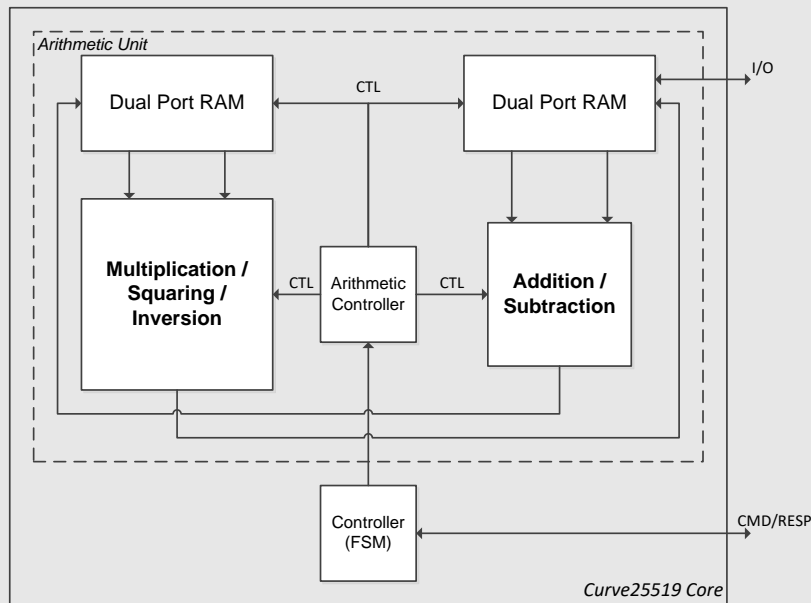

## Double-And-Add:

- adder and multiplier can operate in parallel (2 BRAMs required)
- addition and multiplication operate in butterfly-mode
- point addition and doubling is computed according to Montgomery's ladder
- always compute point doubling and point addition in parallel

## Efficient Elliptic-Curve Cryptography using Curve25519 on Reconfigurable Devices

Pascal Sasdrich, Tim Güneysu

# Single Core Architecture

- Parallel operation:**  
*addition and multiplication can operate in parallel and independently*
- Inversion:**  
*is realized by means of Little Fermat's Theorem using (many) multiplications*
- Controller FSM**  
*manages the Diffie-Hellman computation by calling double-and-add function and final inversion*

**Efficient Elliptic-Curve Cryptography using Curve25519 on Reconfigurable Devices**

6. Conclusion

## Efficient Elliptic-Curve Cryptography using Curve25519 on Reconfigurable Devices

Pascal Sasdrich, Tim Güneysu

# Multi Core Improvements

### 1. Parallelization:

*multiple instances of single core in parallel*

### 2. Dedicated inverter stage:

*inversion is covered by binary EEA based inverter*

### 3. Minimization:

*cores now only support point doubling since inversion is outsourced*

Efficient Elliptic-Curve Cryptography using Curve25519 on  
Reconfigurable Devices

6. Conclusion

**Efficient Elliptic-Curve Cryptography using Curve25519 on Reconfigurable Devices**

Pascal Sasdrich, Tim Güneysu

# Resources | Single Core Architecture

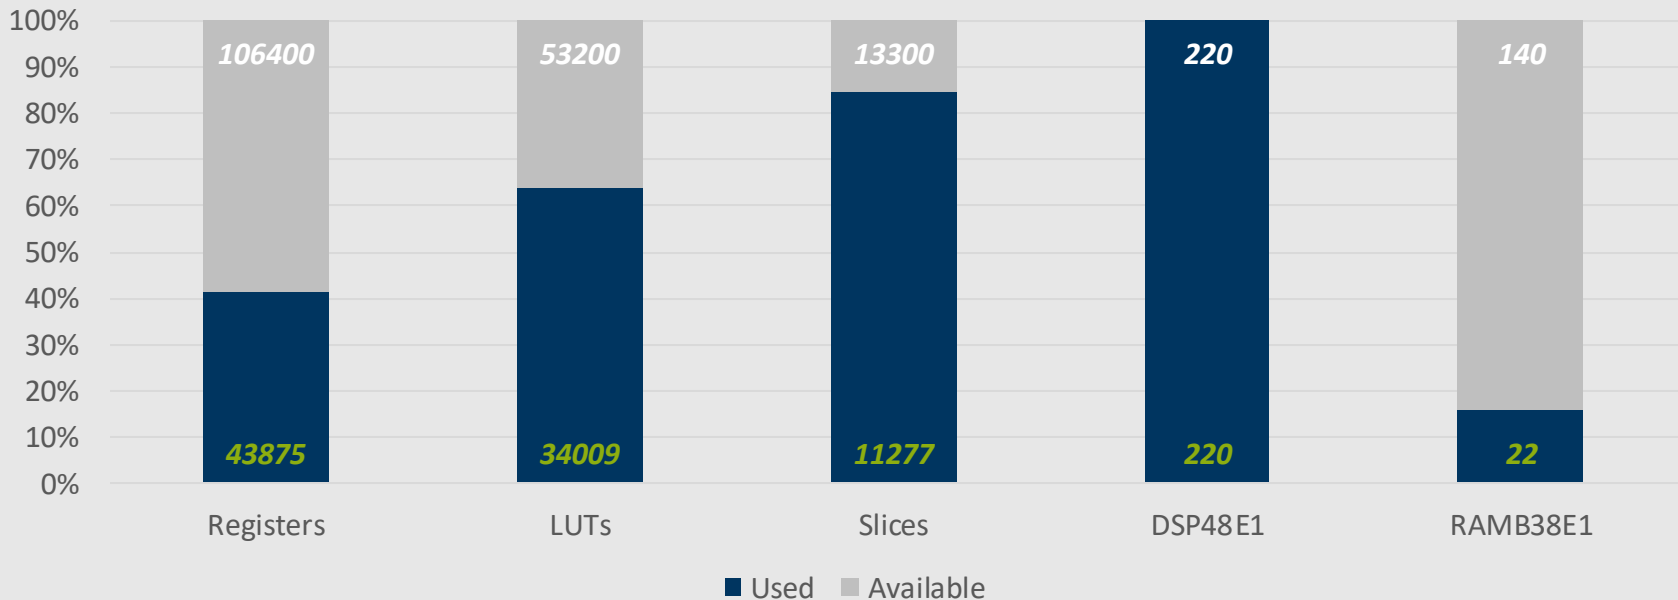

**Single Core Architecture on Zynq XC7Z020:**

- 200MHz clock frequency
- 2518 point multiplications per second

Efficient Elliptic-Curve Cryptography using Curve25519 on Reconfigurable Devices

Pascal Sasdrich, Tim Güneysu

# Resources | Multi Core Architecture

## Multi Core Architecture on Zynq XC7Z020:

- 100MHz clock frequency for inverter, 200 MHz for Curve25519 cores
- 32303 point multiplications per second

## Efficient Elliptic-Curve Cryptography using Curve25519 on Reconfigurable Devices

Pascal Sasdrich, Tim Güneysu

# Results and Comparison

Device	Implementation	Logic	Clock	OP/s
<b>XC7Z020</b>	<b>255-bit (Curve25519)</b>	<b>1029 LS/20 DSP</b>	<b>200 MHz</b>	<b>2518</b>
<b>XC7Z020</b>	<b>255-bit (Curve25519)</b>	<b>11277 LS/220 DSP</b>	<b>100 MHz</b>	<b>32303</b>
XC4VFX12-12	256-bit (NIST)	1715 LS/32 DSP	490 MHz	2020
XC2VP125-7	256-bit (any)	15755 LS/256 MUL	39.5 MHz	260
Intel Core i3	255-bit (Curve25519)	64 bit	2.1 GHz	10810
AMD FX-4170	255-bit (Curve25519)	64 bit	4.2 GHz	14285

5. Results and Comparison
- 6. Conclusion**

# Conclusion

*Curve25519 was designed for fast software implementations but we showed how to implement the curve function efficiently in hardware.*

## Our design convinces with:

- moderate resource requirements (~1000 slices/20 DSP/2 BRAM per core)
- ~2500/~32000 OP/s on single/multi core architecture

**Our design is cheap and easy deployable for many future security applications (e.g. for TOR-Routers and nTor).**
